Final release date for these estimates: July 2005

Revised CPS ASEC Health Insurance Data

As inputs to its models, the 2000 and 2001 SAHIE program uses CPS ASEC data as originally published. In March 2007, the Census Bureau released a User's Note describing an issue in the health insurance edited data that affected estimates from calendar years 1996 to 2005. Later in the Spring, the Census Bureau released a full set of revised estimates from the 2005 and 2006 CPS ASEC's (calendar years 2004 and 2005) in addition to new public use files based on improvements to the algorithm that assigns coverage to non-policyholders. The Census Bureau plans to release a limited set of estimates for the earlier years using an approximation method to simulate the correction. The current SAHIE release is consistent with the full original data product. Future work will consider using the approximation method for modeling. For more details see [revised CPS ASEC health insurance data](#).

Select:

SOURCE: Estimates obtained from models applied to CPS data. Model inputs also include Census 2000 and administrative records data. For information on the data sources, measures of uncertainty, confidentiality protection, and sources of error see [SAHIE source and accuracy](#).

The 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate.
