Tackling the Primary Care Physician Shortage in Arizona

The Problem: Arizona has primary care physician (PCP) shortages in all counties & worse in rural areas.
- Arizona meets just 41.7% of its PCP need.
- Arizona ranks 44th of 50 states in total active PCPs at 77.9 per 100,000 population (U.S. is 91.7).
- Arizona ranks 31st in total active physicians at 235.8 per 100,000 population (U.S. is 271.6).
- Arizona is the fourth fastest growing state in population; Phoenix the fastest growing U.S. city.

Distribution: Most PCPs work in the two largest urban-metro counties, Maricopa and Pima. PCP shortages for underserved populations combined with unequal geographic and specialty creates barriers to health services.
- Arizona has many fewer PCPs compared to specialists per 100,000 population.

Current and Projected Need:

The Health Resources and Services Administration (HRSA) estimates that Arizona needs 563 primary care physicians to eliminate its PCP shortages.

Workforce projections by the Robert Graham Center indicate that Arizona will need an additional 1,941 primary care physicians by 2030, a 50% increase compared to 2010 PCP needs.

Percent Living in a Primary Care Shortage Areas (HPSAs) and Number of Providers Needed to Eliminate Shortage (2018)

Tribal Nation PCPs Needed to Eliminate Shortage (2018)

Arizona Primary Care Physicians per 100,000 by Location (2010)
Reasons for Arizona PCP Shortages:

- Arizona’s PCPs are aging, especially those practicing in rural and underserved areas.
- One-quarter of rural Arizona PCPs plan to retire in the next five years.
- Arizona is the fifth fastest growing state, and third for low income elderly population growth.
- PCPs earn half the compensation of specialist physicians, but graduate with the same debt burden. As a result, fewer medical students choose primary care careers.

Ready Access to Primary and Preventive Care:

- Improves health outcomes
- Enhances access to early prenatal care for expectant mothers which can decrease complications, morbidity and mortality for both the mother and baby
- Lowers the cost of health care
- Decreases emergency department visits and hospital readmission

Recommendation: Grow the Network of Primary Care Physicians and Providers in Arizona’s High Need Areas

Placing and retaining primary care physicians in Arizona’s underserved areas creates jobs in these communities, improves access to health services, and grows the number of field faculty to mentor, precept and train other needed providers including nurse practitioners, physician assistants and allied health providers.

Definition:

HPSAs are a geographic area, population, or facility with a shortage of primary care, dental, or mental health providers and services. HPSAs are based on factors illustrated below. The data in the charts are form the HRSA quarterly report. The percentage of the population living in a HPSA area was calculated by adding the population reported in each HPSA type (geographic, low-income, correctional facility) and then dividing by the total population in the county (extracted from: American Community Survey, 2017).

HPSA Score Formula:

\[
\text{HPSA Score} = \text{Population-to-Provider Ratio} + \text{% Population <FPL} + \text{Infant Health Index} + \text{Travel time to Nearest Source of Care (NSC)}
\]
